Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The vector has insertion sites for foreign DNA fragments and is capable of autonomous replication. It can be used safely as they remain extrachromosomal and are very stable. They can be used to express homologous or heterologous proteins, which may include antigens for use in veccines, nutritional, growth and clotting factors, antimicrobials, vitamins (especially vitamin B12), enzymes, hormones and drugs. The Propionibacterium host cells are used in the production of animal feeds, manufacture of foodstuffs like, sausages and cheese, where they may be used instead of or in addition to lactic acid bacteria and in the manufacture of vitamin B12. The DNA sequence can also be used as a source of primers and probes.
                                                              Mycobacteria expressing secretion signal of lipoprotein and heterologous antigen, esp. outer surface protein A or B of Borrelia burgdorferi - are used in the form of a live bacterial vaccines
                                                                                                                   WPI; 1997-042315/04.

This plasmid was used in the construction of a series of vectors used to produce the recombinant Mycobacteria of the invention. The recombinant mycobacteria of the invention are transformed with DNA encoding a polypeptide which comprises a lipoprotein secretion signal sequence and an antigen (Ag) heterologous to the mycobacteria. The lipoprotein secretion signal causes the Ag to be produced as a lipoprotein. The mycobacteria may be used in the form of a live bacterial vaccines against Lyme disease, where the bacteria express a surface protein of Borrelia burgdorferi, the causative agent of Lyme disease. This sequence is printed in the Specification in the C-terminal to N-terminal orientation as

When the nucleotide was decoded, the sequence in the specification was found to contain several deletions and insertions which upset the reading frame. Also many codons were found to encode amino

A 2586bp HpaI-EcoRV fragment from pYUB12 (comprising the minimum sequence necessary for plasmid replication in BCG) was ligated to PVUII-digested pYUB8 to form pYUB53. (plasmid pYUB8 is a pBR322 deriv. which includes an E.coli replicon and a kanamycin resistance gene). Twelve restriction sites were removed by digesting pYUB53 with hati, EcoRV and PstI. To eliminate 792 bases of the (inactivated) tet gene, the plasmid was digested with NarI and the 6407bp gel purified fragment was religated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   circularised. The resulting plasmid was designated pMV101. The nucleotide sequence of plasmid pMV101 is printed in the specification but the copy quality is too poor to allow the sequence to be included on the GENESEQ nucleotide database. Three proteins are encoded by pMV101, i.e. the kanamycin resistance protein and proteins "d" and "e" encoded by the complementary strand. See also AAR20992 and AAR20993.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA site-specific integration into Mycobacteria - useful as adjuvant in vaccines and as therapeutic agent for malaria, influenza, herpes and human immunodeficiency virus

Type III secretion systems allow bacteria to target virulence factors directly at host cells. The present sequence is a protein of B. pertussis. No name has been specified for the present sequence. The coding sequence of the present sequence is homologous to housekeeping genes of other species, and so the present protein may have a role in cellular housekeeping. A pathogenicity island is a compact, distinct genetic unit carrying virulence genes. The coding sequence of the present sequence is located within a pathogenicity island (see AAA64890) which also carries, a number of genes encoding proteins involved in the type III secretion system of B. pertussis. See AAA64894-A64884 and AAB14111-B14146 for details of the coding sequences and proteins identified in the pathogenicity island, of the present invention.
